

CONCIERGE AGENTS • ELDERCARE

MedMinder Concierge

A safety-first medication routine assistant for seniors and long-distance caregivers.

[Kaggle tested demo](#)

[GitHub artifacts](#)

[Antigravity prototype](#)

PROBLEM STATEMENT

Medication routines are simple until they are not.

The goal is routine support and caregiver context , not medical decision-making.

Seniors

Need reminders and low-friction check-ins without confusing medical advice.

Caregivers

Need timely context when a dose is missed, delayed, refused, or uncertain.

Value

Agents coordinate reminders, package checks, history, and escalation in one explainable flow.

Outcome: safer daily routines + faster caregiver awareness

WHY AGENTS?

The agent is the coordinator.

Medication support has branching context: schedule, safety, packaging evidence, history, and caregiver escalation.

Agents matter because they route the next safe action instead of returning one generic answer.

DEMO

Live demo path: check-in to caregiver alert.

Show the simple experience first, then switch to Kaggle or the local dashboard during recording.

What to show

1. Run check-in
2. Show agent trace
3. Trigger an unsafe case
4. Show caregiver alert path

ARCHITECTURE

A small multi-agent system with safety at the center.

The coordinator routes work through specialist agents and returns a completed check-in, history update, or caregiver alert.

Safety-first rule: MedMinder can support routine confirmation, but it never gives medical advice or proves ingestion.

Architecture of the project

MedMinder Concierge – Safety-First Multi-Agent Architecture

Tested multi-agent workflow runs in the Kaggle notebook. The ADK/MCP package shows the course-aligned extension for local development.

The tested evaluation version runs in Kaggle.

This is the main notebook-based proof: full workflow, edge cases, logs, and exports.

10 / 10

Main coordinator tests passed.

5 / 5

Course-inspired trace evaluation passed.

Artifacts

CSV/JSON trajectory logs and submission outputs.

Safety

Smoke tests and blocked unsafe cases.

Kaggle is my tested evaluation version.

A demo-safe notification path.

The local dashboard can run the workflow, show the trace, save JSON, and optionally send a real ntfy phone alert for escalation cases.

Dry-run first

The first mode creates the exact payload without sending a phone alert.

Real alert optional

For demo only, ntfy can publish to a subscribed topic when escalation happens.

Parallel product prototype workspace.

Antigravity helped structure the app direction separately from the Kaggle evaluation notebook.

Explorer

- backend/app/agents
- coordinator.py
- safety.py
- vision.py
- frontend/src
- README.md + CONTEXT.md

Backend

FastAPI-style structure + agent modules.

Frontend

Phone-style UI and caregiver screens.

Important framing

Kaggle = tested evaluation. Antigravity = parallel product prototype + local workflow companion.

Where judges can explore the project.

GitHub

Public repo with README, architecture, notebook, evaluation files, ADK/MCP package, security docs, and local dashboard.

Kaggle

Main tested notebook: multi-agent workflow, edge cases, tool-call logs, trajectory logs, and outputs.

Antigravity

Build workspace for the parallel backend/frontend prototype and video demonstration.

Make the checklist impossible to miss.

This slide explicitly connects the project to the expected capstone criteria.

Agents

Coordinator + specialist agents in code

MCP server

Tool interface pattern in repo package

Antigravity

Prototype workspace shown in video

Security

Medical guardrails + no committed secrets

Deployability

Local dashboard, docs, and ntfy demo path

Agent skills

Safe check-in skill workflow evidence

FINAL IMPACT

Safe routine confirmation. Caregiver context. Agentic escalation.

MedMinder helps families catch uncertainty earlier while keeping medical decisions where they belong: with clinicians and caregivers.

Safety-first

Explainable workflow

Human-centered
